

Guidelines

Hypo Tile Treatment

Nutech Hypo is a strong alkaline solution designed to kill moss, lichen and algae growth. Hypo is recommended for concrete, terracotta tiles, masonry surfaces, asbestos and cement sheeting.

Hypo can be applied by brush, watering can, hand spray or pump spray units.

It is important to saturate the surface being treated to ensure thorough coverage. In very hot weather spraying the surface with water before treating will improve penetration.

On very thick moss and lichen apply Hypo without dilution directly onto the surface. If the surface has minor growth dilute Hypo with 1:1 water.

It is important to prevent contact with Hypo because it will burn skin, eyes etc and damage clothing. Do not apply in strong wind because vapour inhaled can also burn throat, lung and mouth tissue.

If the roof is connected to water tanks disconnect all down pipes before applying Hypo.

Hypo may discolour new galvanised guttering if applied neat. To prevent surface discolouration fill gutters with water before applying Hypo.

Hypo is converted by sunlight into salt by sunlight over 24 hours and does not harm the environment.

After treatment a surface may be high-pressure water cleaned or left to weather clean over several months.

Hypo does not prevent regrowth of moss and lichen. Sealing the surface after treatment is strongly recommended to slow regrowth.
